NOTE: This is a 'working draft' sequence. It currently consists of 49 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as arbitrary. Gaps between the contigs are represented as This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                   1.                                                                                                                                                                                               ó:
                                        The invention relates to a novel plasmid comprising a cytomegalovirus (CMV) promoter transcriptionally linked with an interferon alphan (IFN-alpha) coding sequence, and a growth hormone 3'-untranslated region (UTR). Sequences AAZ40412 and AAZ40413 represent synthetic 5' and 3' splice donor and acceptor sites respectively for generating a synthetic intron to be inserted into the plasmid of the invention. The plasmids can be used for treating a mammalian condition or disease,
                                                                                                                                                                                              Gaps

ö
The synthetic intron was designed for highly efficient and accurate RNA splicing. The intron was used in the plasmid pIN0773 which can provide for efficient expression of IL-12 subunits. The products can be used for the treatment of asthma, microbial and viral infections and certain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel plasmid comprising a cytomegalovirus (CMV) promoter transcriptionally linked with an interferon alpha (IFN-alpha) coding sequence, and a growth hormone 3'-untranslated region (UTR). This sequence represents the plasmid pIF0921 which contains the human interferon alpha (IFN-a) gene. The plasmids can be used for treating a mammalian condition or disease, particularly cancer.
intron was designed for effective RNA splicing and increased gene expression. The plasmids can be used for (in vivo) transfection of a cell in situ in order to modulate tumnour activity. Anti-anglogenic gene inhibits growth of solid tumnour and lung metastatic tumnours by intravenous or intramuscular delivery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New plasmids containing an interferon-alpha coding sequence, used for the treatment of a mammalian condition or disease, particularly cancer

cencedes human interferon alpha (IFN-alpha). The IFN-alpha coding sequence was inserted into the Valentis plasmid backbone containing sequence was inserted into the Valentis plasmid backbone containing sequence was inserted into the Valentis plasmid backbone containing human growth hormone polyadenylation signal, a pUC12 origin of replication and a kanamycin resistance gene, such that the replication and a kanamycin resistance gene, such that the replication and a kanamycin resistance gene, such that the replication and a kanamycin resistance gene, such that the resulting plasmid, pIF0921, was formulated with poly-L-glutamate to produce a gene delivery vehicle, which was intramuscularly injected into mice; both legs were electroporated with caliper electrodes. A significant enhancement of human IFN-alpha expression in CD-1 mice was observed. This is an example of a method designed for non-viral plasmid-based gene therapy. In this method a nucleic acid is formulated with a non-encapsulating anionic polymer, such as (biodegradable) poly-L-glutamate, which enhances transfection of the nucleic acid into muscle or tumour trisues, with or without electroporation, and which also stabilises the nucleic acid during storage. The formulations allow for deficiencies, as well as cancer and infections. In the case of
                                                                                        The present sequence is that of expression plasmid pIF0921, which

Nucleic acid formulation for gene delivery to a muscle or tumour tissue to treat cancer, or infectious disease in a mammal, comprises a nucleic acid and non-encapsulating anionic polymer such as poly-L-glutamate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of expression plasmid pFN1645, which encodes human Factor IX (FIX). The plasmid has a codon optimised sequence which may be preferred to the natural FIX nucleic acid sequence (in plasmid pFN0945, see AA170086) when higher expression is desired. In experiments with pFN0945, plasmid DNA was formulated with poly-L-glutamate to produce a gene delivery vehicle, which was intramuscularly injected into C578L/6 mice tibialis, augmented by electroporation. The highest expression of human FIX achieved using this method 280 ng/ml, compared with levels of 160 ng/ml obtained with naked DNA treatment. Expression was dose dependent, and the plasmid was stable and transcriptionally active in muscle for a prolonged period of time. Applicability to large animals (dog) was demonstrated. Some muscle damage was observed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polymer, such as (biodegradable) poly-L-glutamate, which not only enhances transfection of the nucleic acid into muscle or tumour tissues, with or without electroporation, but also stabilises the nucleic acid during storage. The formulations allow for excination and treatment of muscle disorders and serum protein deficiencies, as well as cancer and infections. In the case of FIX gene delivery, it may be used to treat haemophilia B.
                                                                                                                                                                                                                                                                                                                                                                                                                                 Plasmid pFN1645; Factor IX; coagulation; blood clotting; human; gene delivery; haemophilia B; gene therapy; vaccine; codon usage;
                                                                                                                                                                                                                                                                                                                                                                                     Codon optimised plasmid pFN1645 for human coagulation Factor IX.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 mth after treatment. This is an example of the method of the
invention for non-viral plasmid-based gene therapy. In this met
a nucleic acid is formulated with a non-encapsulating anionic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Smith LC, Nicol F, Rolland A;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     168911/83
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of expression plasmid pEP1403, which encodes mouse erythropoietin (EPO). The IFN-alpha coding sequence was inserted into the Valentis plasmid backbone containing a 107 bp 5, untranslated region, a 117 bp synthetic intron, the human growth hormone polyadenylation signal, a pUC12 origin of replication and a C kanamycin resistance gene, such that the EPO gene was driven by the cytomegalovirus enhancer/promoter. The resulting plasmid, pEP1403, was formulated with poly-L-glutamate to produce a gene delivery vehicle, which was intramuscularly injected into mice, under clectroporation conditions. Delivery of the plasmid DNA in the poly-glutamate formulation resulted in considerably higher levels of expressed protein than when the plasmid DNA was delivered in C saline. This is an example of a method designed for non-viral plasmid-based gene therapy. In this method, a nucleic acid is formulated with a non-encapsulating anionic polymer, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to treat cancer, or infectious disease in a mammal, comprises a nucleic acid and non-encapsulating anionic polymer such as poly-L-glutamate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid formulation for gene delivery to a muscle or tumour tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the nucleic acid into muscle or tumour tissues, with or without electroporation, and which also stabilises the nucleic acid during storage. The formulations allow for vaccination and treatment of muscle disorders and serum protein deficiencies, as well as cancer and infections. In the case of EPO gene delivery, it may be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rolland A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 3609 BP; 811 A; 1031 C; 953 G; 814 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        to treat cancer, or infectious disease in a mammal, comprises a nucleic acid and non-encapsulating anionic polymer such as poly-L-glutamate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of expression plasmid pFN0945, which encodes human Factor IX (FIX). The plasmid was formulated with encodes human Factor IX (FIX). The plasmid was formulated with encodes human Factor IX (FIX). The plasmid was formulated with encodes intramuscularly injected into C57BL/6 mice tibialis, augmented by electroporation. The highest expression of human FIX achieved using this method 280 mg/ml, compared with levels of 160 mg/ml obtained with naked DNA treatment. Expression was dose dependent, and the plasmid was stable and transcriptionally active in muscle for a prolonged period of time. Applicability to large animals (dog) was demonstrated. Some muscle damage was observed in that after treatment. This is an example of the method of the invention for non-viral plasmid-based gene therapy. In this method, in muscle and is formulated with a non-encapsulating anionic polymer, such as (biodegradable) poly-L-glutamate, which not only enhances transfection of the nucleic acid into muscle or tumour trissues, with or without electroporation, but also stabilises the nucleic acid during storage. The formulations allow for vaccination and treatment of muscle disorders and serum protein deficiencies, as well as cancer and infections. In the case of
                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       In this method,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel plasmid comprising a cytomegalovirus (CMV) promoter transcriptionally linked with an interferon alpha (IFN-alpha) coding sequence, and a growth hormone 3'-untranslated region (UTR). This sequence represents the plasmid pINI143 which contains the human interleukin 12 (IL-12) gene. The plasmids can be used for treating a mammalian condition or disease, particularly cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           plasmids containing an interferon-alpha coding sequence, used for treatment of a mammalian condition or disease, particularly cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  systemic lupus erythematosis; immune-mediated glomerulonephritis; stroke; Parkinson's disease; amyotrophic lateral sclerosis; retinitis pigmentosa; spinal muscular dystrophy; cerebellar degeneration; anaemia; drug; myelodysplastic syndrome; myocardial infarction; cell proliferation; cell differentiation; cell survival; CARD-4L; CARD-4S; CARD-4Y; CARD-4Z; human; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel plasmid comprising a cytomegalovirus (CMV) promoter transcriptionally linked with an interferon alpha (IFN-alpha) coding sequence, and a growth hormone 3'-untranslated region (UTR). This sequence represents the plasmid pINO961 which contains the mouse interleukin 12 (IL-12) gene. The plasmids can be used for treating a mammalian condition or disease, particularly cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   caspase activation; detection; screening; therapy; diagnosis; disease; apoptotic cell death; Ras/APO-1 receptor complex; TWF receptor complex; cancer; follicular lymphoma; carcinoma; p53 mutation; viral infection; hormone-dependent tumour; autoimmune disorder; Alzheimer's disease;

This invention describes the isolation of novel human caspase
recruitment domain, CARD-3 and CARD-4 polynucleotides and proteins and a
recruitment domain, CARD-1 protein and genes. The genes and proteins of
the invention are involved in the regulation of caspase activation.
The caspase recruitment domain (CARD) polynucleotides, polypeptides,
completes and antibodies can be used in screening assays, detection
assays, predictive medicine and therapeutic and prophylactic methods of
treatment. The methods may be used to diagnose and treat patients which
assays, predictive medicine and therapeutic and prophylactic methods of
treatment. The methods may be used to diagnose and treat patients which
assays, predictive medicine associated with abnormal level or rate of
assays, promain activity of the TMF receptor complex, or abnormal
activity of the TMF receptor complex, or abnormal
complex, abnormal activity of the Fas/APO-1 receptor
complex, abnormal activity of the TMF receptor complex, or abnormal
activity of a caspase. Diseases that may be treated include acnoem
complex, abnormal activity of the TMF receptor complex, or abnormal
activity of a caspase. Diseases that may be treated include mutations
constructions and activity of the TMF receptor complex, or abnormal
confections, Alzheimer's disease, parkinson's disease, amyotrophic lateral
coloresis, retinitis pigmentosa, spinal muscular dystrophy, cerebellar

The present sequence is that of CDNA encoding human caspase
recruitment domain 4 long form (CARD-4L, see AAB20080). The CDNA
as isolated from a human umbilical vein endothelial library using
a partial CARD-4S clone as probe. Plasmid pc4L1 containing CARD-4L
CDNA is deposited as ATCC 20335. The human CARD-4 gene (see
AAB20011) maps to chromosome 7. CARD-4 exists in at least 4 forms,
i.e. the long form CARD-4L, the short form CARD-4S (see AAB20081),
and splice variants CARD-4 (see AAB20082) and CARD-42 (see
AAB20082). CARD-4 is an intracellular protein predicted to be
involved in regulating caspase activation. It activates the
INT-kappaB pathway and enhances caspase 9-mediated cell death.
Methods of diagnosing and treating patients suffering from a
disorder associated with an abnormal level or rate of apoptotic
cell death, abnormal activity of the transverse of apoptotic
cell death, abnormal activity of a caspase involve administering a compound
that modulates the expression or activity of CARD-3
cor CARD-6 e.g. a small molecule, antisense nucleic acid, ribozyme
cor polypeptide. Such disorders include cancer, viral infection,
cor polypeptide. Such disorders and immune disorders. CARD-
cor polypeptide. Such disorders and immune disorders. CARD-
cor cancer. And therapy applications, to detect a genetic lesion and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated intracellular proteins predicted to be involved in regulating caspase activation are used for diagnosis and treatment of e.g. cancer. viral infections, autoimmune diseases, neurological diseases and haematological disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ç
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to eytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, mamunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

AAX AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
ce expression by rectifying mutathons or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
co supplement the patients own production of (I). Additionally, (I)
co polynucleotides may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-related diseases, especially
cancers and cancer meterstases of haematopoietic-derived cells. AAK64703
co AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK54942 to AAK84950 and AAM82169
co represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0;

from Umbellularia californica was used with a modified oligo-dr
from Umbellularia californica was used with a modified oligo-dr
primer with restriction sites for Batta, BamHI, HindarII and SalI,
in PCR amplification of a specific acyl-(ACP)-thioesterase
hybridisation probe ("PCR42") from a wild-type Umbellularia californica
cDNA library. Three cDNA clones, designated ClTEI3, CLTES and CLTEI2,
ceach coding for at least part of a thioesterase with medium-chain
specificity (C10:0-specific) were isolated by screening a Cuphea
lanceolata library with probe PCR42. Then, clone CLTE5 was itself
used as a probe to screen a C.lanceolata genomic DNA library and a
total of 23 clones were identified. Four of the genomic clones were
shown to correspond respectively to PCR42 and the three cDNA clones.
The present sequence is that of the genomic clone designated ClTEg1
which corresponds to cDNA clone CLTEI2. The binary vector pNBM99-TEg1
(DSM 8477) comprising a fragment of ClTEG1 is specifically claimed.
The DNA sequences will be useful for transforming oil-producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                An acyl-(ACP)-thio:esterase DNA of medium-chain specificity - isolated from Cuphea lanceolata; for plant transformation to produce Cl0:0 fatty acids, useful in the prodn of eg cosmetics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /number= 7

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 13, 1

Patent No. 5874283

GENERATION:
APPLICANT: Harington, John L.
APPLICANT: Hiebr, Michael
TITLE OF INVENTION: Mammalian Flap-Specific Endonuclease
NUMBER OF SEQUENCES: 63
CORRESPONDENCE ADDRESS:
ADDRESSEE: Townsend and Townsend and Crew LLP
STREET: Two Embarcadero Center, 8th Floor
COUNTRY: California
COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   COMPINE: USA

ZIP: 94111-3834

COMPUTER: READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

COMPUTER: DESTEM: PC-DOS/MS-DOS

SOFTWATNG SYSTEM: PC-DOS/MS-DOS

SOFTWATE: Patentin Release #1.0, Version #1.25

CURRENT APPLICATION DATA:

Double-stranded CDNA was prepared from cell line RNA.
5' and 3' adaptors were used in cloning as follows: 5' adaptor sequence: 5'-ARTCTAGGCCGACATTATGGCC-3' and 3' adaptor sequence: 5'-ARTCTAGAGCCGAGCGGCCGACATG-dT(30)BN-3'
(where B = A, C, or G and N = A, C, G, or T). Average insert size 1.5 kb (range 0.9-4.0 kb). 14/15 colonies contained inserts by PCR. This library was enriched for full-length clones and was constructed by Clontech Laboratories (Palo Alto, CA). Note: this is a NIH_MGC

```
The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized hypothalamus library CDNA Library Preparation: M.B. Soares Lab Clone distribution: Researchers may obtain BNAP cDNA clones from RESEARCH GENETICS. It should be noted that Bento Soares is generating a small number of additional specialized non-redundant arrays of BMAP cDNAs whose availability will be considered under appropriate and limited collaborative arrangements Seg primer: M13 Forward

The cDNAs were ligated purified by ethanol-precipitation. The cDNAs were ligated the LL-Sal4, purified by phenol/chloroform, and separated from free linkers by Centricon 100. Then, the cDNAs were amplified by long-range high fidelity PCR using Ex Taq polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/chloroform and Centricon 100. The cDNAs were digested with Sal1 and Not1 enzymes and cloned into Sal1/Not1 site of pSPORT1 plasmid vector. The DH10B E. coli host was transformed with the ligation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note-"Vector: pSPORT1 (Invitrogen); Site_1: Sal1; Site_2: Motis Mouse cDNA project by the Laboratory of Genetics. National Institute on Aging (NIA), Intramural Research Program, NIH (http://lgsun.grc.nla.nlh.gov/cDNA). This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 1553-1558 (2001). [PMID: 115441991). Total RNAS were extracted from a pool of 20 Blastocysts. Double-stranded cDNAs were synthesized with an Oligo(dT) primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EST 05-NOV-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Butheria; Cetartiodactyla; Ruminantia; Pecora; Bovoidea; Bovidea; Bovidea; Bos.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence is used in the method of invention for tagging genes, transcripts and proteins in cells in a single recombinational event. The method comprises producing a tagged gene by inserting a DNA sequence method comprises producing a tagged gene by inserting a DNA sequence (into an intron of a gene by selecting a DNA sequence having a 5' portion free of any nucleotide sequence selected from AAV43548 to AAV4351, a nucleotide sequence selected from AAV43552 to AAV43560 and nucleotide sequences identical to a known splice branch site in a known gene, sequences identical in length to a known gene, sequence identical to a known splice acceptor sites in a known gene, sequence identical to a known splice or splice acceptor site in a known gene, sequence identical to a known splice once identical to a known constitution of the Nown peptide tag recognisable by a known characteristic of the known peptide tag and sequences selected form CAGG and TAGG. The DNA sequence is inserted into the intron within the gene to create a tagged gene, and the tagged gene is incubated within the gene to create a tagged gene, and the tagged gene is incubated within the geneme of the cell. The method is used for isolating proteins, and transcriptional regulation, for the study of viral infection and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells).

AA283942 to AA28667 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, cells). These transcripts can be used for diagnosis, prognosis, continging and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification compounds that modulate expression of the transcripts are promoters from the transcripts are used to direct expression, in selected promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell the based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides can be used the expand and isolate populations of educated, antigen-specific immune

```
transcripts that are preferentially transcribed in the metastatic breast transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells).

AZEB3942 to AAZEB677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells).

Cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/ampilitation reactions. Compounds that modulate expression of the transcripts are promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense cell types, of e.g. therapeutic genes (also ribozymes or antisense cell types, of e.g. therapeutic genes (also ribozymes or antisense cell based vaccines; for diagnosing breast cancer and for raising useful in vaccines; for diagnosing breast cancer and for raising therapeutic agents. Host cells that produce the polypeptides can be used to estent cells.

Specific antibodies (Ab). Ab are used to detect the polypeptides can be used to estent cells, immune the cerpand and isolate populations of educated, antigen-specific immune affected antigen-specific immune and the immune of the content of the polypeptides and the addition in metastic cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention.

                                                                                                                                                            The sequences given in AAH43525-34 are primers which were used in the production of a fusion gene which comprises a nucleotide sequence encoding the mouse heat shock antigen (HSA) fused to the cDNA sequence of human 1gd1 Fc. The resulting fusion protein may be used in the method of the invention for inhibiting destruction of tissue initiated by autoreactive T cells (aTC). The method is especially used to treat subjects suspected of having autofmmune diseases, particularly multiple sclerosis, rheumatoid althritis, systemic lupus erythematosus, psoriasis, diabetes and allergy, also transplant rejection. Transgentc mice that express human CD24 on their T cells are useful as models for testing drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human ubiquitously expressed transcriptome sequence SEQ ID NO: 311
                                                                                Inhibiting tissue destruction by autoreactive T cells, useful for treating autoimmune diseases, by administering a heat-shock antigen/CD24 polypeptide or its antibody \,
